

SAMORA

YOUR REVENUE HEALTH ENGINE OS

Brand Book

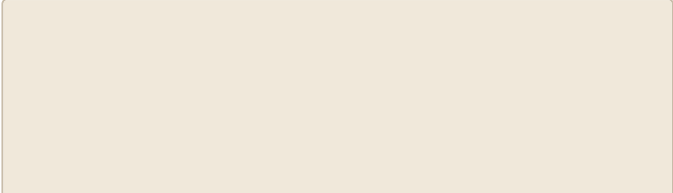

The identity, the interface, and the rules that keep the second one from looking machine made.

REVENGINE SAMORA PRIVATE LIMITED · VERSION 1.0 · AUGUST 2026

The premise

A brand book is usually a colour chart with opinions attached. This one starts from a measurement, because the measurement turned out to be the whole system.

The gold in the mark and the beige it sits on are not two colours that happen to go together. Converted to Oklch, they share a hue to within a fifth of a degree: the gold sits at **81.57 degrees** and the beige at **81.78 degrees**. They are the same colour at different lightness and chroma. Metal and paper, one hue.

	
Gold #B8860B L 0.652 C 0.1322 H 81.6°	Beige #F0E8DA L 0.933 C 0.0206 H 81.8°

So every neutral in the product is built on that one hue at twelve lightness steps. Nothing is grey. Nothing is imported. A card, a table rule, a disabled label and the logo are all relatives, which is why the interface can look like the identity without ever repeating it.

Two caveats, stated rather than buried. The lightness steps are not evenly spaced: they are deliberately compressed at both ends so the palest steps stay paper and the darkest stay ink. And at the top of the ramp, where chroma is under 0.015, eight-bit rounding moves the hue by a few degrees. Neither is visible. Both are in the source.

Everything downstream of that is restraint: one typeface, two corner radii, one border width, two durations. The character comes from the mark and from the warmth of the ramp. The interface itself gets out of the way.

The mark

One continuous ECG trace running a single cardiac cycle. P wave in from the left, the S of Samora sitting where the PR segment runs, QRS complex out to the right. Both tails run into the ring.

Behaviour at size

128px

96px

64px

48px

32px

Rules

Clear space

On every side, keep a margin equal to the ring's band width. Nothing crosses it, including page edges.

Minimum size

Badge on beige: 48px. Badge reversed on the dark ground: 32px. Full stacked lockup: 480px wide. Below those, the trace closes up.

Ground

Beige for warm contexts, the deep brown reversal for anything small or anything dark. Flat gold on white is acceptable for a single-colour print.

Never

Do not recolour the trace separately from the ring, do not remove the ring, do not stretch, do not rotate, do not add a drop shadow, and do not place the stacked lockup in a square avatar slot.

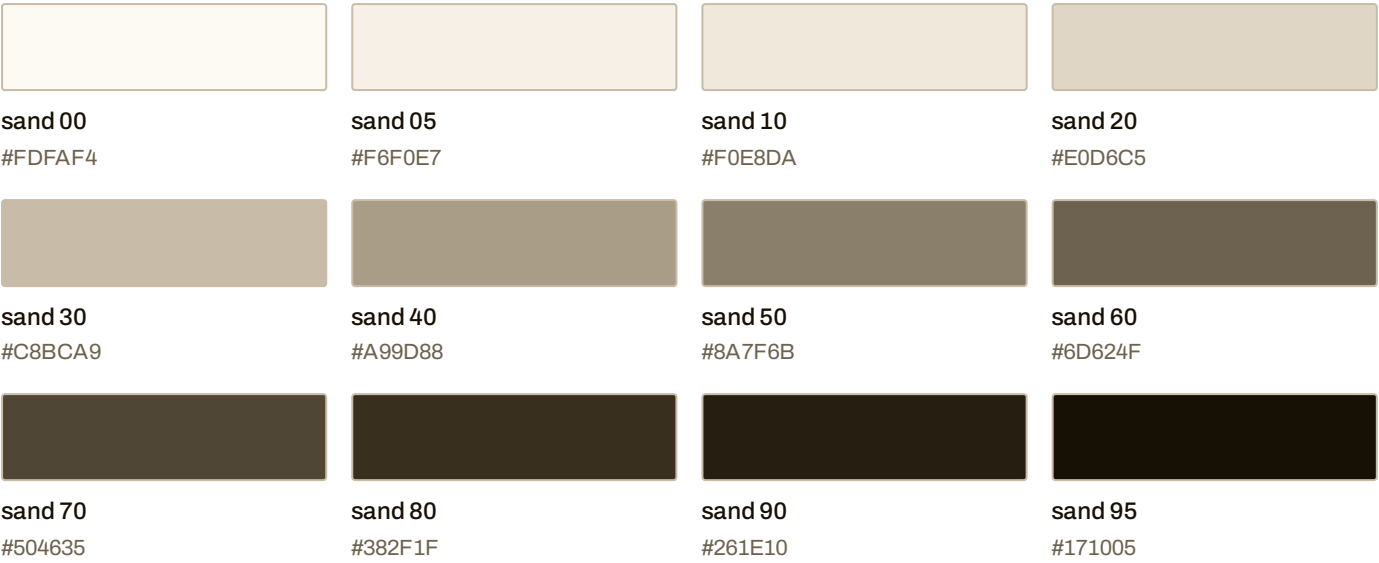

Construction, for reference

S box width	0.60 of its height
Trace stroke	0.154 of the S box height
Ring band	0.150 of the outer radius
P wave	depth 0.085, width 0.560, raised cosine
Interior clearance	0.84 of the inner radius
Tail burial	0.60 into the band, so the cap leaves no crescent
Joins	miter, limit 6

Colour

Twelve neutrals on one hue, four status colours rotated off the gold, and nothing else. There is no blue in this brand unless it is carrying information, and even then it is desaturated to the point of being a slate.

The sand ramp

sand 10 is the brand beige exactly. That is not a coincidence, it is the anchor the ramp was solved around.

Roles

LIGHT	VALUE	DARK	VALUE
--c-canvas	#F6F0E7	--c-canvas	#171005
--c-surface	#FDFAF4	--c-surface	#261E10
--c-surface-2	#F0E8DA	--c-surface-2	#382F1F
--c-surface-3	#E0D6C5	--c-surface-3	#504635
--c-line	#C8BCA9	--c-line	#504635
--c-line-strong	#A99D88	--c-line-strong	#6D624F
--c-text	#171005	--c-text	#F6F0E7
--c-text-2	#504635	--c-text-2	#C8BCA9
--c-text-3	#6D624F	--c-text-3	#A99D88

LIGHT	VALUE	DARK	VALUE
 --c-accent	#B8860B	 --c-accent	#E8B84B
 --c-accent-text	#886100	 --c-accent-text	#DEB771
 --c-accent-solid	#926B14	 --c-accent-solid	#E8B84B
 --c-on-accent	#FDFAF4	 --c-on-accent	#171005
 --c-focus	#AB8230	 --c-focus	#DEB771

Always use the role, never the ramp step. The role is what makes light and dark mode a single decision instead of two stylesheets.

Status

VERIFIED	PARTIAL	AT RISK	INFO	UNVERIFIED
----------	---------	---------	------	------------

Olive for verified, the brand gold for partial, terracotta for risk. Each is a rotation off the gold's own hue rather than a colour borrowed from somewhere else, which is why they sit on the beige without arguing with it.

Contrast, measured

Every pairing below is computed, not assumed, and the build fails if any row fails. Two of these are worth pointing at. The filled gold button is measured against `--c-accent-solid` rather than `--c-accent`, because the display gold only manages 3.1:1 behind text and cannot be a button. And each status colour is measured against its own ten percent wash rather than the bare card, because the wash is what the text actually sits on. Measuring against the card overstates every one of them.

MODE	FOREGROUND	BACKGROUND	MEASURED	MINIMUM	RESULT	WHERE
light	text	canvas	16.66:1	7.0	PASS	body text
light	text	surface	18.11:1	7.0	PASS	body text on a card

dark	info_dk	its own wash	4.65:1	4.5	PASS	info tag text on its 10 percent wash

Typography

One family: **Archivo**. It carries the wordmark, the product and print. Three weights are loaded, so three weights are all that can be used.

Archivo is a grotesque drawn for high performance at small sizes, with unambiguous figures and a real tabular set. That matters more here than in most products, because Samora is mostly numbers in columns. It is also not one of the faces that ships as a framework default, which is half the reason an interface reads as generic.

The scale

Display

44px / 600 / -0.01em / 1.15
var(--t-3xl)

Verified pipeline,
not self-reported

One per page at most. Covers, hero, the number that matters.

H1

34px / 600 / -0.01em / 1.15
var(--t-2xl)

Verified pipeline, not
self-reported

Page title.

H2

26px / 600 / -0.01em / 1.2
var(--t-xl)

Verified pipeline, not self-
reported

Section.

H3

20px / 600 / 0 / 1.25
var(--t-lg)

Verified pipeline, not self-reported

Subsection, card title.

Body large

16px / 400 / 0 / 1.55
var(--t-md)

Verified pipeline, not self-reported

Intro paragraphs, empty states.

Body

14px / 400 / 0 / 1.55
var(--t-sm)

Verified pipeline, not self-reported

Default. Everything unless stated.

Dense

13px / 400 / 0 / 1.45
var(--t-xs)

Verified pipeline, not self-reported

Buttons, form labels, dense panels.

Table

Verified pipeline, not self-reported

12px / 400 / 0 / 1.35
var(--t-2xs)

Table cells. Tabular numerals
always on.

Micro

VERIFIED PIPELINE, NOT SELF-REPORTED

11px / 600 / 0.10em / 1.2
var(--t-3xs)

Uppercase labels. The only place
caps are allowed.

Rules

Tabular figures are always on

Set at the body level, not per component. Money and scores must line up in a column without anybody remembering to ask.

Uppercase only at 11px

With 0.10em tracking, for labels and table headers. An uppercase heading is the fastest way to make a page look like a template.

Running text stops at 68 characters

Set on the paragraph, not on the container, so it holds regardless of what the layout does.

Never more than three weights on one screen

And 600 is a heading weight. If a body paragraph needs 600 to be noticed, the layout is wrong, not the type.

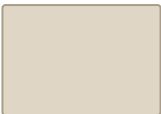

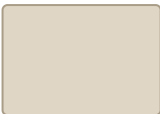

Space, radius, line

A 4px grid, eight steps, no exceptions. Two corner radii. One border width. This is the part of the system that most changes how deliberate a product feels.

Spacing

	--s-1
	--s-2
	--s-3
	--s-4
	--s-5
	--s-6
	--s-7
	--s-8

Radius

		
--r-sm	buttons, inputs, chips, tags	
--r-md	cards, panels, menus, dialogs	
--r-round	avatars and the 6px status dot. Nothing else.	

Density

Control height	32px
Small control	26px
Table row	36px
Border width	1px, one colour
Text measure	68ch

Elevation

Two levels, both nearly invisible, both tinted with the ink rather than pure black. Shadows are for things that genuinely float. A card does not float.

Flat. The default.	Level 1. Menus.	Level 2. Dialogs.
--------------------	-----------------	-------------------

Motion

Two durations, one curve, and a named property every time.

TOKEN	VALUE	USE
<code>--dur-fast</code>	120ms	hover, focus, colour change
<code>--dur-slow</code>	200ms	enter, exit, size change
<code>--ease</code>	cubic-bezier(0.2, 0, 0, 1)	everything

```
/* wrong */
transition: all 0.2s;

/* right */
transition: background-color var(--dur-fast) var(--ease),
            border-color var(--dur-fast) var(--ease);
```

The fast duration belongs to hover, focus and colour. The slow one belongs to things that enter and leave, which in this system is exactly one component: `.pop`, used for menus and dialogs. If a third duration seems necessary, the interaction is wrong, not the scale.

Everything respects `prefers-reduced-motion`. That is handled once in the token file, so no component has to think about it.

Components

Live, not pictures. Everything below is rendered by the same token file you will paste into the product, so what you see here is what ships.

Diagnosis

This section exists because the complaint was specific: the product looks machine made. That is a fair reading, and it is measurable. Here is what the current stylesheet actually contains.

Emoji used as interface icons

330 uses, 51 distinct

This is the single loudest tell. Emoji render differently on every platform, cannot be recoloured, cannot be sized to the grid, and read as a chat window rather than a product. Nothing else on this list matters as much.

Corner radii

21 distinct declarations

2, 4, 5, 6, 7, 8, 9, 10, 12, 14, 16, 20px

A radius set this wide is a sign that each component was decided on its own. The eye cannot name the shape language, so it reads as assembled rather than designed.

Type sizes

22 distinct values

9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 24, 28, 32, 36px

Sixteen of these are in active use. Ten of them differ from a neighbour by 1px, which is a difference nobody can perceive but every layout has to absorb.

Colour literals

93 distinct, 33 hex and 60 rgba

#6366f1, #60a5fa, #2563eb, #1d4ed8, #78716c, #44403c, #1c1917, #f97316, #1a1a2e

Every one of those is a framework default: indigo-500, blue-400, blue-600, blue-700, stone-500, stone-700, stone-900, orange-500, and the stock dark-theme navy. They sit next to a warm gold brand and fight it.

Padding

76 distinct declarations

no shared grid

Spacing decided per component means nothing lines up across components. This is what people mean when they say a UI feels loose.

Transitions

16 distinct, 13 of them transition: all

transition: all 0.2s

transition: all animates properties you did not intend, including layout, which is why hover states feel slightly wobbly. It is also the default anyone writes when they are not thinking about motion.

Gold drift

product gold is not brand gold

#A0752A and #C9973E in the app, #B8860B and #C8961E in the identity

Two golds, neither of which matches the letterhead. The identity and the product look like two companies.

None of this is a failure of taste. It is what happens when every component is decided at the moment it is written. A system removes that moment.

The ten rules

If you only read one section, read this one. These are the decisions that separate a product that looks authored from one that looks assembled.

01 No emoji anywhere in the interface

Not in buttons, not in empty states, not in alerts, not in menu items. If a thing needs an icon, it gets a drawn icon on a 20px grid with a 1.5px stroke, matching the weight of the ECG trace in the mark. If no such icon exists, the thing gets a word instead. A word is always better than a rocket.

02 Two radii, and one of them is reserved

2px for anything you click or type into. 3px for anything that contains other things. 999px exists for avatars and the 6px status dot, and for nothing else. There are no pills in Samora. A status is a small rectangle with a hairline, because a rectangle looks decided and a pill looks decorative.

03 Borders do the work that shadows usually do

One hairline, one colour, one pixel. Two elevation levels exist and both are almost invisible: they are for things that genuinely float, which is menus and dialogs and nothing else. A card does not float. Stacked soft shadows are the visual signature of a component library, not of a product.

04 Never write transition: all

Two durations. 120ms for anything that responds to the pointer, 200ms for anything that enters or leaves. One curve, cubic-bezier(0.2, 0, 0, 1), which starts fast and settles. Name the property you are animating. If you cannot name it, do not animate it.

05 No colour that is not a token

If a hex code appears anywhere outside the token file, it is a bug. This is the rule that keeps a framework default from creeping back in, because a framework default has no token to live in. There is exactly one white in the system, `--c-print-paper`, and it only applies on paper.

06 The gradient belongs to the logo and to paper

The gold ramp is for the mark, the letterhead and print. In the product, gold is one flat value. A gradient button is the most recognisable machine-made detail there is.

07 **Three weights, and caps only below 12px**

400, 500, 600. Nothing else is loaded, so nothing else can be used. Uppercase with letterspacing is permitted at 11px for labels and at nothing larger. Uppercase headings look like a template.

08 **Numbers are tabular, right aligned, and never coloured alone**

Money and scores line up in columns because the figures are the same width. Colour is never the only carrier of meaning: a status has a label as well as a colour, so it survives being printed, screenshotted, or read by someone colourblind.

09 **Density is a decision, not an accident**

Controls are 32px tall. Table rows are 36px. Running text stops at 68 characters. These are fixed so that two screens built by two people on two days still look like one product.

10 **Empty states and errors are sentences**

Write what happened and what to do next. No shrugging, no exclamation marks, no apologies with emoji. The house rule on em dashes applies here as everywhere: Samora does not use them.

Voice

Samora sells certainty about numbers. The writing should sound like someone who has already checked.

Specific over enthusiastic. A count, a date, a name. Never a promise, never an exclamation mark, never an apology dressed up as a mascot. When something fails, say what failed and what the user is looking at instead.

House rules

No em dashes, ever

In any Samora content, anywhere. Use a comma, a full stop, or restructure the sentence.

Sentence case for everything except 11px labels

Button text, menu items, headings. Title Case Everywhere reads as a template.

RevEngine is one word, camel case

The legal entity is RevEngine Samora Private Limited. Never all caps, never two words.

The product is Samora, the platform is SamoraTrack

Use Samora when speaking as a company, SamoraTrack when naming the software.

How to adopt this

The token file does most of the work. The rest is deletion.

1. Load Archivo at 400, 500 and 600. Nothing else.
2. Paste `samora-tokens.css` in place of the current `:root` block and the light and dark overrides.
3. Run the mapping table below and replace every old variable.
4. Delete every emoji in the markup. Where one carried meaning, use a word.
5. Search the file for `#` and `rgba(`. Every remaining hit is a bug.
6. Search for `transition:all` and name the properties.
7. Search for `border-radius` and reduce every value to `var(--r-sm)` or `var(--r-md)`.

Variable mapping

TODAY	REPLACE WITH	NOTE
--bg	--c-canvas	page ground
--surface	--c-surface	cards
--surface2	--c-surface-2	hover, inset
--surface3	--c-surface-3	wells, tracks

--serif, --sans	--font	one family

TODAY	REPLACE WITH	NOTE
--ease	--ease	value changes, name stays

Icons

Emoji come out. In their place, use a single stroke set at 1.5px on a 20px grid so the icons carry the same line weight as the ECG trace. Phosphor Icons at regular weight is a good fit and is MIT licensed. Avoid Lucide: it is the default that ships with the component library everyone recognises, which puts you back where you started.
